We claim:

1. In a multimedia telecommunications network, a method of processing multimedia calls, the method comprising:

receiving at a first network element a multimedia call from a caller using a first communication device to a prepaid wireless user using a second communication device, the prepaid wireless user having an amount of airtime remaining for the second communication device;

displaying in real-time a plurality of available call features and the amount of airtime remaining on the second communication device;

prompting the prepaid wireless user to select the call features from the plurality of available call features via the second communication device;

receiving the user's selected call features at the first network element;
routing the selected call features from the first network element to a second
network element and then to the caller;

setting up the call according to the selected call features; and connecting the call.

- The method defined in claim 1, further comprising:
 where the prepaid wireless user desires to add more airtime, running a prepaid
 wireless collection routine.
- 3. The method defined in claim 1, wherein the multimedia call is one of voice call, a fax message, a video call, a high-quality voice transmission, a file transfer, or a messaging service.
- 4. The method defined in claim 1, wherein the first communication device is one of a wireless telephone, a personal computer, a notebook computer, or a personal digital assistant.

- 5. The method defined in claim 1, wherein the second communication device is one of a wireless telephone, a personal computer, a notebook computer, or a personal digital assistant.
- 6. The method defined in claim 1, wherein the available call features include the amount of airtime available for each type of call and the corresponding call quality.
- 7. The method defined in claim 1, wherein the selected call features include the type of call and the quality of the call.
- 8. The method defined in claim 1, wherein the telecommunications network includes an IP multimedia subsystem.
- 9. The method defined in claim 6, wherein the first network element comprises a call session control function in the IP multimedia subsystem.
- 10. The method defined in claim 7, wherein the second network element comprises an application server in the IP multimedia subsystem.
- 11. In a multimedia telecommunications network, a system for processing multimedia calls, the system comprising:

means for receiving a multimedia call from a caller using a first communication device to a prepaid wireless user using a second communication device, the prepaid wireless user having an amount of airtime remaining for the second communication device;

means for displaying in real-time a plurality of available call features and the amount of airtime remaining on the second communication device;

means for prompting the prepaid wireless user to select the call features from the plurality of available call features via the second communication device; means for receiving the user's selected call features at the first network element;

means for routing the selected call features from the first network element to a second network element and then to the caller;

means for setting up the call according to the selected call features; and means for connecting the call.

- 12. The system defined in claim 11, further comprising means for running a prepaid wireless collection routine.
- 13. The system defined in claim 11, wherein the multimedia call is one of voice call, a fax message, a video call, a high-quality voice transmission, a file transfer, or a messaging service.
- 14. The system defined in claim 11, wherein the first communication device is one of a wireless telephone, a personal computer, a notebook computer, or a personal digital assistant.
- 15. The system defined in claim 11, wherein the second communication device is one of a wireless telephone, a personal computer, a notebook computer, or a personal digital assistant.
- 16. The system defined in claim 11, wherein the available call features include the amount of airtime available for each type of call and the corresponding call quality.
- 17. The system defined in claim 11, wherein the selected call features include the type of call and the quality of the call.
- 18. The system defined in claim 11, wherein the telecommunications network includes an IP multimedia subsystem.
